BRICK WORK · MILESTONE A

Onboarding

Goal: a new user goes from a fresh install to their own collection through one guided flow: a local catalogue with set part lists, API keys, collection import, and how the inventory works.

Rough length: 5–6 weeks (was 3–4 before #101) · Gate: issue #88

WHY

The pieces exist. A newcomer cannot find the path through them.

Today

A first-run panel on the empty Sets list links out to Catalogues & keys, Collection sync, Add and the BrickTracker import, each on its own page.

After A

One resumable flow: the catalogue with set part lists, keys, bring your collection in, then a short guide. It can be reopened from Manage.

Already built: Rebrickable and Brickset pull and send (#10), the BrickTracker import with preview (#11). Still to build: the local catalogue with part lists (#101), the other-app file imports (#12), the flow and the guide.

THE WORK

Four steps in one flow, a local catalogue, three ways in

Issue	Work item
#83	The guided first-run flow: resumable, skippable, reopened from Manage
#85	Step 1: BrickLink catalogue first, with an explainer
#101	Local catalogue with set part lists; API only as fallback
#84	Step 2: API keys, where to get each, paste and Test
#86	Step 3: bring your collection in, choosing where it lives today
#87	Step 4: how the inventory works
#10	Collection sync with Rebrickable, Brickset and BrickLink (file)
#11	Import from BrickTracker, any version, fresh or merge
#12	Import from other apps: Rebrickable CSV, BrickLink XML, Brickset CSV

THE GATE · #88

A fresh install reaches its own collection without leaving the flow

- On a fresh install on test, the flow runs end to end without a trip to the docs
- A set the catalogue knows is added with no API call except its images
- Every import path in step 3 works, or says plainly it is not available yet
- #10, #11 and #12 closed, or their remainder moved to the roadmap with Ulf’s yes
- Tests and check.sh green; release notes drafted
- Close-out: this deck becomes the milestone’s status report
